

Dear Sir/Madam,

We are requesting you to mentor us for the project. (Write 3-4 lines about your interest for the Project)

The project, **Biometric Template Reconstruction Attack Detection**, aims to determine whether a biometric template, whether a fingerprint, face, or iris, has been reconstructed. The system uses a deep learning system to recognize artifacts, noise patterns, and structures typical of a reconstructed template. The project will help increase the level of security around biometric authentication by determining whether a template is original or reconstructed, thereby thwarting attacks associated with template inversion attacks.

Based on the proposed scope of work, this UROP project can be considered an extension of the foundation of the Capstone project because it aims to widen the scope of both research and analysis. Therefore, the methodologies, results, and experimental setup of the UROP project form the foundation of the Capstone project.

Thanking you,
